SMART SCHEDULE BUILDER

Core Optimization & Constraint Programming Engine — Source Code Documentation

Module File:	backend/app/services/scheduling_engine.py	**Class Name:**	GLIXONSchedulingEngine
Technology Stack:	Google OR-Tools CP-SAT (v9.15), Python 3.12, NumPy	**Algorithm:**	Constraint Programming & Sat Solver (CP-SAT)
Domain Support:	Colleges (S1–S8), Companies/Offices, Airlines/Aviation	**Primary Objective:**	Feasible, Non-Conflicting, Workload-Balanced Schedules

1. MODULE OVERVIEW & ARCHITECTURE

The **GLIXONSchedulingEngine** is the computational core of the Smart Schedule Builder. It formulates the complex multi-resource scheduling challenge as an exact **Constraint Satisfaction and Integer Programming Optimization Problem** utilizing Google OR-Tools CP-SAT solver. It supports high-cardinality multi-department deployments, automatically distinguishing between academic faculty, corporate staff, and airline flight crew members.

2. KEY MATHEMATICAL CONSTRAINTS ENFORCED

Constraint Type	Mathematical Formulation & Rule	Target Entity
Hard Constraint 1: No Overlap	For any resource or person *p*, sum(assigned(p, s)) ≤ 1 across overlapping time slots.	Faculty, Employees, Rooms, Aircraft
Hard Constraint 2: Qualification Match	Assigned person must possess required subjects, certifications, or verified operational skill rating.	Subject Teachers, Duty Roles, Pilots
Hard Constraint 3: Working Hours Limit	Total scheduled hours per week ≤ configured max_hours_per_week.	All Personnel (Fairness Bound)
Hard Constraint 4: Rest Periods & Shifts	Enforces mandatory 10–12 hour rest buffers between shifts to prevent burnout and ensure safety.	Aviation Crews, Healthcare, Staff
Hard Constraint 5: Shift Window Bounds	Persons can only be scheduled within configured working days (Mon–Fri) and shift hours (09:00–17:00).	Corporate & Academic Staff
Soft Constraint 6: Fairness & Balance	Minimizes variance in workload across peers: minimize sum((hours(p) - target_hours)²).	Organization-wide Objective

3. COMPLETE SOURCE CODE LISTING

Below is the complete, unmodified implementation of scheduling_engine.py:

```python
import datetime
from typing import List, Dict, Any, Tuple
from ortools.sat.python import cp_model
from app.core.time_utils import (
    parse_time_to_minutes,
    calculate_shift_duration_minutes,
    calculate_shift_duration_hours,
    get_slot_datetime_interval,
    is_overlapping_interval,
    is_overnight_shift,
)

class SchedulingEngine:
    """
    Real Constraint Programming Scheduling Engine using Google OR-Tools CP-SAT.
    Enforces mandatory constraints:
      - No overlapping assignments for the same person (including overnight shifts)
      - No assignment during confirmed unavailability or approved leave
      - Required skills and qualifications
      - Working-hour limits
      - Resource availability (no double-booking of rooms/labs/wards)
      - Organization-specific constraints
    Optimizes soft constraints:
      - Workload fairness (minimize max deviation)
      - Staff preferences
      - Overtime penalties
    """
